

DermaWave No-Needle™ MESOTHERAPY

Over 80% of adult women are cellulite experts. Cellulite, or dimpled skin on the thighs, buttock and abdomen appears to have little regard for lifestyle- even those who exercise regularly are not immune. Cellulite impacts women the most and men are rarely affected, partly due to the fact female skin is thinner and hormonal changes may play an important role.

As Skin ages, collagen and connective tissue lose their elasticity and the dermis is weakened. The aging process also affects the metabolic, endocrine and vascular systems, which may result in an inability to efficiently discharge waste products. The resulting accumulation of waste products causes alterations in connective tissue and the fat cells, (which are held in a framework of collagen), enlarge impact blood vessels and cause edema or swelling. The fibrous bands that normally maintain skin tension become less elastic and trap the displaced cells resulting in the cottage cheese appearance.

Mesotherapy the Euro chic treatment for cellulite, was pioneered in France by Dr. Michel Pistor, and has been performed there since 1952, now a popular treatment for reducing the appearance of cellulite in the United States. The technique involves the injection of homeopathic substances to act upon cellulite within the mesoderm. While the treatment is very successful, treatments involve a series of injections that may be painful or cause bruising. Not to mention some would never entertain a series of injections, due to fear of needles regardless of the potential outcome.

Imagine Mesotherapy with NO-Needles! Introducing a new treatment

"DermaWave No Needle Mesotherapy" The DermaWave treatment is based on a new technique called Aquaphoresis, which uses specialized electrical waveforms to help reactivate specific physiological processes in tissue that contribute to the formation of cellulite. These include microcirculation, lymph drainage and enhanced blood flow.

The DermaWave No Needle Mesotherapy uses advanced technology, Aquaphoresis, to deliver active topicals to a selected tissue depth. Aquaphoresis uses the natural water channels in the skin to exploit a bioactive process known as Aquaporin Transfer™. The technique allows transfer of molecules that would not normally pass through the skin.

The DermaWave uses a roller head to apply the topical solution; the treatments are painless, without systemic effects and results are evident very early in the treatment series.

Treated areas may include cellulite reduction and skin tightening in the buttocks, thighs, abdomen as well as upper arms. The DermaWave is also utilized in facial rejuvenation to stimulate the production of collagen and reduce the appearance of fine lines.

Dr. Cooperrider, of Laser Treatment Center, a Board Certified Dermatologist in Kirkland, Washington since 1977, is the local specialist utilizing DermaWave. Dr Cooperrider a pioneer in his field is the first and only physician to date in the state of WA to offer this cutting edge procedure DermaWave No Needle Mesotherapy, contact Laser Treatment Center for your complimentary consultation, 425-899-4144.
